

**National Interagency Coordination Center
Incident Management Situation Report
Friday, July 6, 2007 - 0530 MDT
National Preparedness Level 2**

National Fire Activity

Initial attack activity: Heavy (365 new fires)
 New large fires: 6 (*)
 Large fires contained: 1
 Uncontained large fires: 16
 Area Command Teams committed:
 NIMOs committed:
 Type 1 IMTs committed: 2
 Type 2 IMTs committed: 4
 Fire Use Teams committed: 3

** Uncontained large fires do not include WFU or confine/contain incidents. **

Eastern Great Basin Area (PL 3)

New fires: 32
 New large fires: 1
 Uncontained large fires: 3
 Type 1 IMTs committed: 1
 Fire Use Teams committed: 1

Neola North, Uintah and Ouray Agency, BIA. IMT 1 (Martin). Three miles north of Neola, UT. Brush and timber. Torching and spotting. Structures and a municipal watershed remain threatened.

Jungle, Manti-Lasal NF. FUMT (Ourada/Soper). Thirteen miles west of Ferron, UT. Timber litter. Spotting and isolated torching. Structures threatened. Road and trail closures in effect.

Black Rock Gulch, Arizona Strip Field Office, BLM. Thirty miles south of St. George, UT. Grass and brush. Running and torching. Communications site and structures threatened. Evacuations in effect.

Predictive Services Discussion: Very hot, dry and unstable conditions will continue in the West. Thunderstorms, some of them dry, are expected today over portions of the Four Corner states, the Great Basin, western Wyoming, northern California, and Oregon. The northern and central interior of Alaska will see hot weather with very low humidity along with some wet thunderstorms expected in the southern interior. The Southeast will have scattered thundershowers today through the weekend.

http://www.nifc.gov/sixminutes/dsp_sixminutes.php

HEAT DISORDERS

Heat becomes a problem when humidity, air temperature, and radiant heat combine with hard work to raise body temperature beyond safe limits. Sweat is your main defense. Everyone on the fireline must understand the importance of drinking water often.

● High heat stress can produce three forms of heat related illness;

- Heat cramps
- Heat exhaustion
- Heat stroke

● The mildest is heat cramps. Heat cramps can progress to heat exhaustion and eventually heat stroke.

● Heat cramps are involuntary muscle contractions, typically in the large muscle groups, caused by failure to replace fluids or electrolytes, such as sodium and potassium.

- Cramps can be relieved with stretching and by replacing fluids and electrolytes.
- Heat cramps can be prevented by maintaining an adequate intake of water, electrolyte replacement drinks and by eating fresh fruits and vegetables.

● Heat exhaustion is characterized by:

- Weakness
- Extreme fatigue
- Nausea
- Headaches
- Wet, clammy skin

● Heat exhaustion results when the body produces more heat that it can dissipate. Inadequate fluid intake is a major contributing factor. Treat heat exhaustion by resting in a cool environment, by removing clothing so that one's sweat can evaporate, and by replacing fluids and electrolytes.

● Heat stroke is caused by failure of the body's heat controls. Sweating stops and the body temperature rises.

● Although classic teaching describes a heat stroke patient as "hot and dry", recent studies have shown that over 50% of heat stroke patients are sweating heavily. Typically, on the fireline we do not have medical thermometers. Therefore, the hallmark of heat stroke is altered mental status. You should suspect heat stroke if a firefighter is hot, fatigued, and shows some altered mental status, such as inability to remember the day or the current situation. They may ask, "Where am I?"

● Heat stroke is characterized by:

- Hot, often dry skin
- Body temperature above 105.8 degrees Fahrenheit
- Mental confusion
- Loss of consciousness, convulsions, or even coma

● Heat stroke is a medical emergency. Brain damage and death may result if treatment is delayed. Begin rapid cooling with ice or cold water, fanning the victim to promote evaporation. For rapid cooling, partially submerge the victim's body in cool water. Treat for shock if necessary. Provide oxygen if it is available. Whereas heat cramps and heat exhaustion may be treated locally, heat stroke patients should be medivaced off the line ASAP, by air if possible, as their condition may worsen suddenly.

● You can prevent the serious consequences of heat disorders by improving your level of fitness and becoming acclimated to the heat. Maintaining a high level of aerobic fitness is one of the best ways to protect against heat stress. The fit worker has a well-developed circulatory system and increased blood volume. Both are important to regulate body temperature. Fit workers start to sweat sooner, so they work with a lower heart rate and body temperature. They adjust to the heat twice as fast as the unfit worker.
