

**National Interagency Coordination Center
Incident Management Situation Report
Friday, August 27, 2010 – 0530 MDT
National Preparedness Level 2**

National Fire Activity

Initial attack activity:	Moderate (204 new fires)
New large fires:	11 (*)
Large fires contained:	4
Uncontained large fires: **	17
Area Command Teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	3
Type 2 IMTs committed:	6

Nationally, there are 62 large fires being managed to achieve multiple objectives.

** Uncontained large fires include only fires being managed under a full suppression strategy. **

Predictive Services Discussion: Significant fire potential is forecast today for portions of Nevada and the Rockies due to dry and windy conditions. The strongest winds are expected from the Sierras to the Rockies and into the Great Plains. Scattered thunderstorms are on tap over southern California, Great Basin, Southwest and Rockies. Most of the West will be cooler with hot weather continuing over the Plains.

[Link](#) to Predictive Services Outlook products.

Today's discussion is from
"This Day in History"

"Lessons Learned" serve as brief summaries of powerful learning opportunities. You can use these summaries as a foundation and launch point for further dialogue and discussion. Apply these lessons learned to yourself, your crew, and your unit.

SEAT Accident, Meeker Colorado, August 27th 2008

Incident Summary: A Single Engine Air Tanker (SEAT) is directed by Air Attack to drop on the right flank of the Flat Bush Fire. During the first retardant drop the SEAT's flight pattern takes the aircraft in close proximity to staged firefighters and vehicles. During the drop sequence the pilot's side cockpit door comes open and forces him to abbreviate the drop. The pilot relays to Air Attack that he has a problem with his "door", and having just seen the abbreviated drop, Air Attack assumes the problem door is the retardant gate. He asks several times about the status of the pilot and aircraft. At no time did Air Attack understand that the problem was actually with the cockpit door and the pilot never fully conveys the true nature of his problem. The pilot requests to jettison the remaining retardant. Air Attack assumes the problem is corrected and asks the pilot to reinforce the previous drop. The pilot agrees with this request instead of asking to land to fix the problem. On approach for the second drop, the pilot uses an aggressive turn at low altitude to align the aircraft for the drop. The approach is directly over the top of the firefighters again. As a result of the aggressive maneuver, the aircraft stalls and crashes. Debris from the accident damages two wildland fire engines and narrowly misses the six firefighters. The aircraft's engine lands just 6 feet from an occupied vehicle. The crew is unharmed, the vehicles receive minor shrapnel damage, and although the aircraft is destroyed, the pilot only receives minor injuries.

Lessons Learned Discussion Points

Apply the concept of LCES to this incident; not from a fire perspective but an aviation point of view.

(L) Lookouts look for hazards (situations and actions) and communicate them. Aircraft flying directly overhead are a hazard. Helicopters accidentally release longlines, buckets and sling loads multiple times each season. Water and retardant drops often miss intended targets, creating the potential for injury by the drops themselves or debris from vegetation.

- What other ways can "lookouts" be utilized in aviation?

(C) If you see something wrong...say something! Communication is about being understood.

- Discuss what might have been communicated about this pilot's first drop that may have prevented the crash on the second.

Most of us have seen something that may have been unsafe but didn't say anything.

- Have your group discuss reasons why that happens. Have your group come up with one good way to avoid that dilemma and plan to practice it today.

(E & S) Just as for wildland fire, escape routes and safety zones are needed for aviation operations as well. The ground personnel on this incident may have been in a safe location in regards to the fire but not in a safe location in relation to the aircraft. Keep in mind that if something goes wrong with an aircraft, ground crews may not have time to move to a safer location. If you are in the flight path of an aircraft, communicate it. Either you can be moved or the aircraft can.
