

**National Interagency Coordination Center
Incident Management Situation Report
Monday, June 4, 2012 – 0530 MT
National Preparedness Level 2**

National Fire Activity

Initial attack activity: Light (84 new fires)
 New large fires: 3 (*)
 Large fires contained: 3
 Uncontained large fires: ** 11
 Area Command Teams committed: 0
 NIMOs committed: 0
 Type 1 IMTs committed: 1
 Type 2 IMTs committed: 3

** Uncontained large fires include only fires being managed under a full suppression strategy.

Southwest Area (PL 3)

New fires: 9
 New large fires: 2
 Uncontained large fires: 4
 Type 1 IMTs committed: 1

Whitewater-Baldy, Gila NF. IMT 1 (Sciaccia). Fifteen miles east of Glenwood, NM. Timber. No new information.

Gladiator, Prescott NF. Started on state land one mile east of Crown King, AZ. Timber. Smoldering.

Montezuma, Papago Agency, BIA. Twenty miles southeast of Sells, AZ. Timber and grass. Creeping and smoldering. Structures threatened.

Alexis, Capitan District, New Mexico State Forestry. Eight miles northeast of Hondo, NM. Grass. Active fire behavior.

Predictive Services Discussion: Scattered showers and thunderstorms will push across the Northwest and northern Rockies as a deepening trough moves into the western U.S. Hot and dry conditions will continue in the Southwest and Great Basin while gusty winds develop ahead of the trough. Isolated to widely scattered thunderstorms will develop over the central and southern Rockies. A strong trough in the eastern U.S. will produce rain and scattered thunderstorms from the upper and mid-Mississippi Valley to the East coast. In Alaska, building high pressure will warm and dry the region. Isolated thunderstorms will develop in the central Interior and West coast.

<http://www.predictiveservices.nifc.gov/outlooks/outlooks.htm>

**Today's discussion is from the
Fireline Safety Category.**

Hazard Trees

Snags (dead, standing trees without leaves or needles in the crowns) and other hazard trees present a significant hazard to wildland firefighters. Snags typically have much lower fuel moistures than live, green trees; and they burn more readily. In the process, they often throw fire brands far in advance of the main fire and often burn through more quickly than green trees, falling with little or no warning. Live, green trees have been weakened by insects, disease, weather, past fires, and age present equal hazard and can fall without warning.

- The risk of injuries from hazard trees increases during the night operational period when visibility is greatly reduced.
- While the cooler, nighttime period is generally a more effective time to gain control of wildfires, the increased risk from unseen falling snags and weakened live trees may limit the widespread use of crews at night in areas of dead and dying timber.
- Environmental conditions that increase risk from hazard trees: Strong winds or erratic winds from storm cells. Night operations. Air operations - cargo drops, water or retardant drops, helicopter take off/landing, low-level flights. Steep slopes. Diseased or bug-killed areas.
- Things to consider when assessing the potential dangers of hazard trees: Trees have been burning for an extended period. High-risk tree species (those that are known for rot and shallow root systems) are in the area. Numerous downed trees. Dead or broken tips and limbs overhead. Accumulation of downed limbs. Tree decay, cavities, splits, cracks. Absence of needles, bark or limbs. Leaning or hung-up trees. Roots damaged by equipment or erosion.
- Mitigation measures to take: Identify and flag all high-risk areas until the hazard has been removed. Keep personnel out of the high-risk areas until the hazard has been removed. Use saw teams and falling bosses. Establish lookouts. Plan a quick and safe escape route. Do not turn your back on a falling tree. Maintain situational awareness.
