Predictive Services Discussion: Cool weather will settle into the northwest quarter of the Nation as an upper level low pressure system moves east through the region. Showers are expected to stretch along a frontal system from the northern Rockies through the Great Basin. Breezy conditions are anticipated over the high passes and deserts of southern California, while heavy rainfall may develop further west along the coast where remnant tropical moisture could produce flooding. It will remain breezy in the central and southern Plains states with generally dry and warming weather. In the south, a moist stream of Gulf moisture will focus along a stationary front with showers and thunderstorms along the Coast.

ON A HILLSIDE WHERE ROLLING MATERIAL CAN IGNITE FUEL BELOW

Operational Engagement Category

When firefighters find themselves in Watchout Situation #13, they must answer the following questions:

- Can you locate/construct a line to prevent material from rolling below? What do you call line that catches rolling material? Describe how you would construct this type of line and what factors you would have to consider (e.g., slope, fuels, etc.)
- Will you get enough warning of rolling material to prevent being hit by it? Who needs to be watching for rolling material? What kinds of warning systems could you establish?
- Can you see where any material that rolls below you goes and what it does? What can happen when material rolls out of the fire and below you out of view? What needs to be done to mitigate this danger?
- Is the area free of large amounts of flashy fuels? Review the Common Denominators of Tragedy Fires.
