**Predictive Services Discussion:** The upper level ridge of high pressure will begin to weaken today as the front edge of it is eroded by another front dropping south into the Great Plains early in the day and as a low pressure area south of the ridge in the eastern Pacific Ocean moves north and begins to strengthen. Temperatures will remain excessively hot across most of the West and afternoon humidity levels will remain quite low with poor overnight recoveries. Monsoonal moisture trapped in the ridge will continue to allow for the development of widely scattered dry and marginally wet storms over the western Great Basin, California, and Oregon. A few storms could also develop over the Washington Cascades as well, but they will be very isolated. Wet conditions are expected along the East Coast as another strong and wet front slowly moves east from the Mississippi and Ohio River valleys.

## COMMON DENOMINATORS OF FIRE BEHAVIOR ON TRAGEDY FIRES

*Weather / Fire Behavior Category*

Five common denominators that contribute to accidents/incidents have been identified through studies of tragedy fires. It is important for firefighters to readily recognize the following common denominators so that future tragedies can be prevented:

- Most incidents happen on smaller fires or on isolated portions of larger fires.
- Most fires are innocent in appearance before unexpected shifts in wind direction and/or speed results in flare-ups or extreme fire behavior. In some cases, tragedies occur in the mop-up stage.
- Flare-ups generally occur in deceptively light fuels, such as grass and light brush.
- Fires run uphill surprisingly fast in chimneys, saddles, gullies, and on steep slopes.
- Some suppression tools, such as helicopters or air tankers, can adversely affect fire behavior. The blasts of air from low-flying helicopters and air tankers have been known to cause flare-ups.
