

**National Interagency Coordination Center**  
**Incident Management Situation Report**  
**Thursday, May 31, 2018 – 0530 MT**  
**National Preparedness Level 2**

**National Fire Activity**

Initial Attack Activity:	Light (58) new fires
New large incidents:	3
Large fires contained:	2
Uncontained large fires:**	5
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	2

Nationally, there are 3 large fires being managed under a strategy other than full suppression.

\*\*Uncontained large fires include only fires being managed under a full suppression strategy.

**Predictive Services Discussion:** Critical fire weather conditions are expected across portions of the Southwest as the upper level trough along the coast strengthens slightly and begins to slowly move inland. Breezy southwesterly winds along with the typically low afternoon humidity levels will create an active burn environment across the Four Corners Region. Further north, scattered showers and storms will be possible across the central and northern Great Basin and the Northern Rockies as a cold front moves across the region. As has been the case thus far, storms should be wet. Hot and humid conditions are expected across the Great Plains as high pressure extends from central Mexico up to Hudson Bay in Canada. In the East, a passing front will incorporate moisture from the remnants of the tropical storm to create another soggy day from the Mississippi River east to the coast, excluding New England where high pressure will keep things warm and dry.

In Alaska, low pressure in the Gulf and another along the Arctic Coast will keep moisture in place across the state's interior regions. Expect another day of scattered showers and wet storms. The driest areas with the lowest precipitation probabilities will be across the northern Interior from Fort Yukon west to Galena where a weak high pressure ridge will keep most of the shower activity at bay.

## Vehicle Entrapment

Vehicles/Roads Category

If you find yourself in a fire entrapment situation where a shelter deployment is not possible, using a vehicle for refuge may be an option. The following are some considerations for a vehicle entrapment:

- Park the vehicle in an area void of vegetation.
- Burn out around the vehicle if there is time.
- Park behind a natural barrier or structure. Consider that a structure could become involved which could severely impact nearby exposures/vehicles ([Harris Fire, SoCal, 2007](#)).
- Do not park on the downhill side of a road or under power lines or over-hanging vegetation.
- Stay out of saddles and draws.
- Position the vehicle in a direction that provides the area occupied by crew personnel the maximum protection from an approaching flame front.
- Set the parking break, leave the motor running at high RPM, and keep the vehicle lights on.
- Roll up the windows and do not lock the doors since someone else might need to get in.
- Cover windows with fire shelters with reflective material placed against window.
- You must protect your airway; remain as low in the vehicle as possible, and use a dry bandana to cover your nose and mouth.
- Expect the following conditions if you are trapped inside the vehicle:
  - Temperatures may reach over 200 degrees Fahrenheit.
  - Smoke and sparks may enter the vehicle.
  - Plastic parts may start to melt and give off toxic gases.
  - Windows may start to crack.
  - Exposed skin may receive radiant heat burns.
- If the vehicle catches fire, or windows blow out, and you must exit the vehicle before the fire has passed, then:
  - Each crewmember should cover themself with a fire shelter.
  - Exit the vehicle from the side away from the greatest heat.
  - Stay together and get as low to the ground as possible, moving away from the vehicle.
  - Deploy your shelter in a safe area.
