

National Interagency Coordination Center
Incident Management Situation Report
Friday, May 10, 2019 – 0800 MT
National Preparedness Level 1

National Fire Activity (May 3 – May 9)

Initial attack activity:	Light (561) new fires
New large incidents:	5
Large fires contained:	4
Uncontained large fires:**	2
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	0
Type 2 IMTs committed:	2

Nationally, there is 1 large fires being managed under a strategy other than full suppression.

**Uncontained large fires include only fires being managed under a full suppression strategy.

 ***Additional wildfire information is available through the Geographic Areas at <http://gacc.nifc.gov/>

Predictive Services Discussion: The forecast period begins with a warm and dry ridge of high pressure in place over the Pacific Northwest and western portions of the Northern Rockies. Beneath the ridge, snowpack melting rates will accelerate and fuels will continue to dry. In the Southwest, an extended period of cool and wet conditions is setting up as a slow moving low pressure system begins to impact Southern California, Arizona and New Mexico and lingers over the region until Monday. High pressure over the central and Northern Great basin should provide for overall warm and dry temperatures north to the Canadian Border. By Tuesday night, a pattern change is expected to develop as a trough of low pressure begins to drop southeast from the Gulf of Alaska. As the ridge of high pressure over the Great Basin strengthens and begins to move into the Great Plains, the low pressure trough off the Pacific Northwest coast will fracture and move on shore. This will produce a noticeable cooling trend. Furthermore, it will bring much needed precipitation to Northern California, Nevada, the Pacific Northwest, and the Northern Rockies on Wednesday and Thursday. Temperatures during this period will be cooler than average and the models indicate that this pattern may persist several days longer beyond this forecast period. Also, there are subtle hints in the data that high elevation snow may be on the way in the Pacific Northwest and the Northern Rockies just after the tail end of this forecast period. In Alaska, expect for fire activity to pick up as an extended warm and dry pattern develops across the eastern Interior in response to a strengthening ridge of high pressure that is expected to develop over the Yukon Territory and drift west through the period.

Aviation Communications

Aviation Category

Discuss the following information in terms of effective communication with aircraft. Involve the pilot in this discussion.

- Establish an air-to-ground frequency on the fire, and make sure everyone knows what it is.
- Avoid switching frequencies in the middle of an operational period.
- Discuss Guard frequencies:
 - How they work.
 - When to use them.
 - What frequencies are established for aircraft in your area?
- Aviation communications should be clear, concise, short, and to the point.
- Use standard terminology that can be understood by all people you are talking to. Do not use local slang.
- Know what you want to say before you key the microphone. Don't think and talk at same time.
- Before you key your microphone to talk, be sure to listen to ensure you don't cut into another transmission
- Identify who you want to talk to by the call sign and identify yourself in every transmission.
- If the frequency gets congested, request another frequency. Upon receipt, ensure that all people who need to be on the new frequency transfer to that frequency.
- When giving ground descriptions, describe the location as if you are viewing the location from the direction an aircraft would be traveling. Use a common frame of reference for the sender and receiver.
- Use easily understandable directions, such as north, south, east, west, 2 o'clock, 9 o'clock, left 20 degrees, right 45 degrees, etc.
- When giving directions, always give them in relation to the pilot's perspective.
