

**National Interagency Coordination Center  
Incident Management Situation Report  
Thursday, August 13, 2020 – 0730 MDT  
National Preparedness Level 4**

**National Fire Activity:**

Initial attack activity:	Light (93 new fires)
New large incidents:	4
Large fires contained:	8
Uncontained large fires:***	32
Area Command teams committed:	0
NIMOs committed:	1
Type 1 IMTs committed:	5
Type 2 IMTs committed:	5

Nationally, there are 12 large fires being managed under a strategy other than full suppression.

\*\*\*Uncontained large fires include only fires being managed under a full suppression strategy.

TOTALS	33	547	3,010	968,610

\*1 Hectare = 2.47 Acres

**Predictive Services Discussion:** The previous day's front will move into the Dakotas taking most of the convective activity with it. However, isolated storms will be possible across southwestern Montana. Isolated storms will also be possible across the southern Sierra as a weak disturbance moves north along the back side of the Four Corners High. Monsoonal moisture will remain trapped in the ridge over the Four Corner States and will lead to the development of scattered wet storms in the afternoon. Breezy and dry conditions will continue across the Pacific Northwest as a cool, post frontal northwesterly flow continues. In the East, a weak but hot high pressure ridge will linger. Hot and humid conditions will lead to the redevelopment of scattered storms in the afternoon from the Virginias south to the Gulf Coast.

## SAFETY ZONES 1 (LCES)

*Operational Engagement Category*

A safety zone is a location where the threatened firefighter can find adequate refuge from an approaching fire.

- What is the difference between a safety zone and a deployment site?
  - The safety zone is the area where a firefighter can survive without using a fire shelter. The deployment site is used when fire conditions are such that escape routes and safety zones have been compromised.
- How do you identify a good safety zone?
  - Consider the distance from the escaped fire as well as topography, winds, fire behavior, and fuels in the area.
  - The best locations are usually “in the black;” those with a minimum of, or devoid of, ground/aerial vegetation; or large bodies of water.
  - Location is scouted and marked well for visibility at all times.
  - Location has been reassessed in relation to line work progress, fatigue, changes in fire behavior, and arrival of additional resources.
  - For radiant heat only, the distance separation between the firefighter and the flames must be at least four times the maximum flame height. This distance must be maintained on all sides; if the fire has ability to burn completely around the safety zone. Convective heat from wind and/or terrain influences will increase this distance requirement.
  - Take advantage of heat barriers such as lee side of ridges, large rocks, or solid structures.
- What should you avoid in selecting a safety zone?
  - Avoid locations that are downwind from the fire.
  - Avoid locations that are in chimneys, saddles, or narrow canyons.
  - Avoid locations that require a steep uphill escape route.
