

National Interagency Coordination Center
Incident Management Situation Report
Friday, December 4, 2020 – 0800 MDT
National Preparedness Level 1

National Fire Activity (November 27 – December 3, 2020):

Initial attack activity:	Light (203 new fires)
New large incidents:	4
Large fires contained:	5
Uncontained large fires:***	4
Area Command teams committed:	0
NIMOs committed:	0
Type 1 IMTs committed:	1
Type 2 IMTs committed:	0

Nationally, there are 2 fires being managed under a strategy other than full suppression.

***Uncontained large fires include only fires being managed under a full suppression strategy.

Southern California Area (PL 2)

New fires:	91
New large incidents:	2
Uncontained large fires:	4
Type 1 IMTs Committed:	1

* **Bond**, Orange County Fire Authority. IMT 1 (Cal Fire Team 4). Three miles north of Silverado, CA. Chaparral, brush and grass. Active fire behavior with uphill runs, wind-driven runs and flanking. Communities of Silverado Canyon, Williams Canyon and Modjeska Canyon threatened. Evacuations, area, road and trail closures in effect.

* **Airport**, Corona Fire Department. Two miles northwest of Corona, CA. Brush and grass. Moderate fire behavior. Road closures in effect.

SQF Complex, Sequoia NF, USFS. Thirty-three miles east of Porterville, CA. Timber and chaparral. Minimal fire behavior. Numerous residences threatened. Area, road and trail closures in effect.

Creek, Sierra NF, USFS. Thirty-five miles northeast of Clovis, CA. Timber, brush and litter. Minimal fire behavior with smoldering. Area, road and trail closures in effect. Last report unless significant activity occurs.

***Prescribed fire acres are for reference only and may not reflect the most up-to-date information.

***Official prescribed fire accomplishment reporting occurs through agency specific systems of record.

Predictive Services Discussion: Strong upper-level ridging will dominate over the western and central CONUS for much of the next week. An exception will be an upper low sliding south over California and the western Great Basin this weekend into early next week before likely tracking east across the Southwest and northwest Mexico later in the week. Upper-level troughing is forecast over the eastern CONUS through mid-next week as multiple upper lows track east from the southern Plains and drop south from Canada.

This pattern will lead to average to above average temperatures in the western and central CONUS and mostly below average temperatures over the East. Overall, much of the western and central CONUS will remain dry for the next week, although precipitation is expected in portions of the Pacific Northwest and Northern Rockies at times. Precipitation is also expected in portions of the Southeast into the Mid-Atlantic and Northeast today into the weekend.

The ongoing Santa Ana wind event will diminish by Saturday night, but offshore winds will continue across California with surface high pressure remaining in the Great Basin and low pressure off the coast. Additionally, the track of the upper low this weekend into next week over California will enhance offshore winds with another moderate to strong Santa Ana wind event forecast on Monday and Tuesday in southern California. Gusty north-

northeast winds across portions of northern California on Sunday and Monday will also increase fire potential. There is a chance of light precipitation in portions of southern California and the Southwest late next week, but uncertainty remains and is unlikely to be a season ending event.

Hypothermia

Firefighter Health & First Aid

Hypothermia occurs when your core body temperature falls below normal. It can easily happen in cold winds or wetness. Hypothermia can also occur in moderately cool temperatures, particularly if coupled with dehydration. People tend to forget to drink on cool, wet days and can get hypothermic even when the temperature stays well above freezing.

- Symptoms of hypothermia include:

- Slurred speech.
- Weakness and loss of coordination.
- Confusion.
- Irrational behavior.
- Uncontrollable shivering (although, at extremely low body temperatures, shivering may stop).
- Pale and cold skin.
- Drowsiness – especially in more severe stages.
- Slowed breathing or heart rate.

Your body automatically begins to shiver to warm itself. As your energy is used up to keep warm, you may reach a point where your body will be unable to warm itself. If left untreated, your body will gradually shut down; and you can die.

- You can avoid hypothermia with the following precautions:

- Guard against dehydration.
- Avoid fatigue.
- Avoid cold winds.
- Take precautions, change out of wet clothes.
- Be aware of the symptoms and take action upon their onset.

- If you recognize hypothermia, take the following steps:

- Move the patient to shelter.
- Remove wet clothes and replace them with warm, dry garments.
- If the victim is alert, give them food and warm liquids to drink.
