Predictive Services Discussion: Critical fire weather is expected today in Northern California. Strong offshore winds and very low humidities will spread across most of the geographic area, greatly impacting new and existing fires burning in the region. Widespread breezy conditions east of the Rockies and into the Corn Belt will manifest due to a cold front but humidities will be mostly above critical thresholds. Very hot and dry weather will be present for much of Southern California, the Southwest, and Texas. Scattered precipitation is likely for the Cascades of Washington, Idaho Panhandle, and western Montana.

Entrapment Avoidance

Operational Engagement Category

Avoiding situations where firefighters become entrapped is the first concern when devising strategy and tactics. The following discussion points are among the things that should be considered.

- Discuss the three types of safety zones and describe examples.
 - The burn
 - Natural features
 - Constructed sites
- Discuss the guidelines for distance separation to avoid radiant heat injury.
 - Four times the maximum flame height (20 feet-flame height x 4 = 80 feet radius from firefighters)
 - Discuss size based on amount of resources and equipment in the area.
- Discuss heat impact factors that will affect the guidelines for distance separation.
 - Convection heat from wind and terrain features
 - Location relative to fire spread
 - Reburn potential of fuel in safety zone
- Discuss how firefighters have a right to know the location of their escape routes and safety zones at all times.
- Discuss how firefighters have a right to ask for clarification when faced with unclear instructions or fear of the unknown.
- Describe a basic procedure for identification of effective escape routes and safety zones.
 - Observe
 - Visualize
 - Identify
 - Time
 - Inform
 - Evaluate
