Predictive Services Discussion: Upper-level troughing will move into the Pacific Northwest, extending into northern California and the Northern Rockies. An associated cold front will push through the Pacific Northwest and into northern California, the northern Great Basin, and Northern Rockies. Hurricane Ida will weaken into a tropical storm as it moves north-northeast through the Lower Mississippi Valley. Tropical storm conditions will continue along its track with widespread heavy rain expected in the Lower Mississippi Valley. Elevated to critical west to southwest winds are expected in the Cascade gaps, the interior Northwest, the northern Sierra, Lake Tahoe Basin, much of the Great Basin, and western Wyoming. The strongest winds will occur over the Sierra Crest and into western Nevada. Southwest winds will remain gusty with poor overnight RH recovery for the higher elevations of the Sierra into western Nevada, particularly over the eastern slopes including the Tahoe Basin. Dry/breezy conditions are also possible along eastern slopes/gaps in the Coast Ranges of California. Isolated to scattered monsoon thunderstorms are likely across Arizona, New Mexico, southern Colorado, and southeast California.

Extreme Fire Behavior – II

Weather – Fire Behavior Category

Changes in fire behavior are always present in incidences of shelter deployment. Firefighters need to maintain situation awareness of live and dead fuel moisture conditions, as well as predicted and current weather conditions. As fire behavior moves from mild to moderate to extreme, it is critical to respond correctly to the changing situation.

- Discuss how the following factors can contribute or lead to extreme fire behavior:
 - Frost kill: late or unusually extensive freezes, high loading of frost-killed fuels.
 - Drought Conditions: Live Fuel Moistures Index, Keetch-Byram Drought Index (KBDI), Soil Moisture Index, low humidity, high temperatures.
 - Slope: increases fire spread uphill, preheats fuels by convection; may channel winds.
 - Sea Breeze/Foehn: wind direction may vary throughout the day; humidity changes may occur; strong wind velocities may drive fire behavior.

- To aid situation awareness:
 - Track National Fire Danger Rating System (NFDRS) live and dead fuel moisture outputs.
 - Take hourly weather observations and track the hourly changes. By tracking fuel moisture and weather observations and using the Fire Severity Related to Fuel Moisture Chart, firefighters can be alerted to conditions leading to situations where there is a high potential for extreme fire behavior.
