Predictive Services Discussion: An upper-level shortwave trough will break down the ridge over far northern California and the Northwest later today and tonight as it moves into the region. A strong upper high will remain over Nevada, with ridging extending over much of the West into western Canada. An upper-level trough will deepen over the Upper Midwest and Great Lakes as an upper low drops south into Ontario, with an associated cold front pushing south through the central Plains and Great Lakes. Well above normal temperatures will continue across the West, with below average temperatures from the northern Plains into the Great Lakes. Isolated thunderstorms are possible in northwest Oregon and western Washington as the upper-level trough moves into the Northwest, with convective showers likely in western Oregon and Washington. Dry and breezy conditions are likely in south-central Oregon into northeast California and along and east of the Coast Ranges in northern and central California. Dry and windy post-frontal conditions are expected across the northern Plains into Minnesota, with isolated to scattered thunderstorms and showers over the Great Lakes, including northeast Minnesota.

Firefighter Nutrition

Firefighter Health & First Aid

Nutrition is a critical part of the health and safety of wildland fire suppression personnel. This is the fuel for the body to perform the work and maintain cognitive abilities. Wildland firefighters on the fireline need 4,000 to 6,000 calories a day to avoid an energy deficit. Consider the following key points when choosing your meal:

- There are three major energy sources in food: carbohydrates, protein, and fats.
- Carbohydrates (also called sugar) offer an immediate source of energy for your body. They provide the fuel for your muscles and organs, such as your brain.
- Proteins are the basic building blocks of the human body. They are made up of amino acids that help build muscles, blood, skin, hair, nails, and internal organs.
- Fat is an essential nutrient that provides energy, energy storage, insulation, and contour to the body.
- National Technology and Development Program (NTDP) recommends eating 150 to 200 kcals every two hours during the work shift to maintain blood glucose and energy levels.

Carbohydrates:

- Studies on athletes have shown that carbohydrates are the most critical energy source for performance and health.
- Carbohydrates are your body's first choice for fuel. If given a choice of several types of foods simultaneously, your body will use the energy from carbohydrates first.
- If you do not eat enough carbohydrates, the following can occur:
 - Fatigue.
 - Muscle cramps.
 - Poor mental function.
- Fire camp lunches are designed to allow firefighters small amounts of food (primarily carbohydrates) that can be easily eaten throughout the work shift.

Discussion Points:

How are you eating your fire lunch? Is it all at once or in small amounts throughout the day? Think of long-duration events (ultra runs, triathlons). Do athletes stop for a big meal or eat small amounts constantly throughout the race?
