Predictive Services Discussion:

Widespread record heat will envelop the northern half of the Intermountain West today. A potent upper-level disturbance will shift north around the western edge of the building heat dome, bringing increasing thunderstorm chances to California and the western Great Basin. Some dry lightning will be likely over the Sierra, but localized flash flooding could occur over recent burn scars despite northwesterly storm motions as high as 30-40 mph. Isolated mixed wet and dry thunderstorms will also be possible for the coastal ranges in southern California and Cascades. Dry thunderstorms may become a bit more likely overnight into northern California as the disturbance aloft lifts northwards. An increase in showers and thunderstorms is expected in the Southwest, with an increase into the Four Corners, with strong outflow wind gusts to 50 mph in portions of eastern Utah and the West Slope.

Temperatures as hot as 105-110°F will occur across the California Central Valley, in addition to eastern Washington, Oregon, and parts of Idaho, while highs near or above 100°F are expected for eastern Montana, Wyoming, and the Great Basin. Minimum relative humidity from 5-15% will be likely throughout most of these areas. Hot and dry conditions will continue in northern and western Texas into parts of Oklahoma, but a few thunderstorms are possible near the Red River as a weak front moves in. Gap winds are forecast to increase through the Cascades this afternoon, with local gusts over 30 mph possible. Otherwise, thunderstorm outflows will be the main culprit for gusty winds in the West and Great Plains.
