Ten Year Average	Quantity
Fires (2014 – 2023 as of today)	1,128
Acres (2014 – 2023 as of today)	17,135

Changes in some agency YTD acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

Fire weather and potential concerns remain low into much of next week across the US. However, dry and breezy conditions are likely today in portions of southwest Texas ahead of and behind a cold front. As an upper-level trough moves from the Rockies over the Plains, rainfall will spread from the southern Plains through much of the Southeast today into tomorrow then through the Ohio Valley and up the East Coast tomorrow through Sunday. Most of the precipitation will fall as rain, but snow is likely in portions of the eastern Great Lakes, central and northern Appalachians, and New England. A drying and warming trend will emerge across the central and eastern US, especially for the northern and central Plains into the Upper Midwest and Great Lakes, this weekend and next week behind the trough's passage.

Precipitation will continue across much of the northwestern US, especially along and west of the Cascades, into the weekend. Temperatures will warm across the West through early next week, and an atmospheric river is expected to move over the West Coast mid to late next week. Widespread precipitation will likely spread from the West Coast into the Intermountain West, with high snow levels initially. Dry and breezy conditions are likely to emerge on portions of the High Plains late next week ahead of the upper-level trough over the West. A drying trend is likely with increasing winds by early next week for Hawai'i, but another frontal passage should bring increased moisture and showers to the islands next week. Below normal temperatures are likely to persist across much of Alaska into next week, but the panhandle into southeast Alaska will warm to above normal.
