Cumulative acres showing in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

Breezy and dry southwesterly winds of 15-30 mph with gusts to 40 mph amid low relative humidity will develop across southern and eastern New Mexico into far West Texas today creating elevated to critical conditions. Widespread showers and thunderstorms will delivery ahead of a cold front from the Great Lakes Southwest into north Texas. Several of these storms will be severe, particularly in the Mid-Mississippi and Lower Ohio Valleys where strong tornadoes are possible. Scattered showers and isolated thunderstorms will develop across the Intermountain West, with snow in the mountains. Snow will gradually end in the eastern Dakotas and northern Minnesota, while mixed precipitation moves into northern New England.
