## **Predictive Services Discussion:**

The strong storm in the central Plains will move into the Mid-Mississippi Valley tomorrow. Strong westerly winds will occur ahead of the cold front and west of the dry line from southeast New Mexico through much of Texas, pushing into East Texas, eastern Oklahoma, and western Louisiana in the afternoon. Minimum relative humidity will fall to 5-20% across these areas, possibly as low as 10% as far east as East Texas. Widespread critical to extremely critical conditions are forecast, although conditions across Oklahoma are likely to be mitigated by recent rainfall, elevated initial attack may continue there.

Strong to severe thunderstorms will develop ahead of the dry line in the Lower Mississippi Valley tomorrow, while strong southerly winds develop in the Southeast. Southerly winds of 15-25 mph are forecast, and while minimum relative humidity will increase to near or above 20%, elevated to critical conditions are likely. Of particular concern will be the west slopes of the Appalachians, especially far eastern Tennessee late this afternoon and tonight. A period of strong downslope winds gusting to 70 mph are expected along with poor overnight relative humidity recovery, creating localized areas of extremely critical conditions. Precipitation is likely to arrive in the southern Appalachians toward Wednesday morning, greatly moderating the conditions.

On the north side of the storm, widespread precipitation is forecast from the central Plains to the Great Lakes. Snow is forecast on the northern periphery with blizzard conditions likely from northeast Colorado and western Nebraska into central Minnesota. Another upper-level low will move onto the West Coast during the day, with light valley rain and mountain snow from central California into the Northwest.
