Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

Isolated to locally scattered mixed wet and dry thunderstorms will develop across far northeast California and eastern Oregon into the northern and eastern Great Basin and much of the Rockies. With minimum relative humidity falling to 7-20% across much of the Intermountain West, several new ignitions are likely. New and existing fires may also be fanned by outflow wind gusts near 50 mph. Isolated dry thunderstorms may redevelop after midnight in northern Utah and northwest Colorado. Isolated mainly wet thunderstorms will develop in the central and southern High Plains. Hot temperatures will continue for one more day in the Carolinas, with isolated showers and thunderstorms developing in the afternoon. Scattered showers and thunderstorms will develop in much of the Mid-Atlantic bringing relief from last week's heat, while scattered showers and thunderstorms develop along a cold front in the northern Plains. Above normal temperatures are expected in Alaska, with well above normal temperatures for the North Slope which will approach 80°F. Super Typhoon Bavi will gradually move west of the Northern Mariana Islands, with winds and heavy rainfall slowly diminishing.
