Predictive Services Discussion:

Monsoonal moisture beneath an upper-level ridge will bring another round of wet and dry thunderstorms across much of the West today. Cloud cover may limit storm development, but isolated to scattered showers are expected. Dry thunderstorms are possible along the northern edge of the moisture across central Idaho, Montana, and Wyoming, while dry and breezy conditions persist across parts of the northern High Plains. Onshore flow of 10-15 mph will develop across the central California coast ranges and Central Valley, where relative humidity may fall to 10-25%. The Pacific Northwest will remain between high pressure and an offshore trough, supporting strong southwesterly winds and thunderstorm development. Locally heavy rainfall is possible west of the Cascades, while storms in southwestern Oregon are more likely to remain dry. The upper ridge will continue to produce above-normal and potentially record-breaking heat from the northern Rockies through New England and into the mid-Atlantic, with highs of 95-105°F possible. Meanwhile, heavy rain will continue across central Texas into the middle and lower Mississippi Valleys, where flood watches remain in effect.
