**Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.**

## **Predictive Services Discussion:**

The breakdown of a strong upper-level ridge will lead to critical fire weather conditions today across a significant portion of the Western US. The most extreme conditions are expected over eastern Washington into northeast Oregon where sustained winds 20-25 mph and gusts to 40 mph will coincide with relative humidity values dropping into the teens by afternoon. Across the remainder of eastern Oregon, southern Idaho and into the Great Basin, relative humidity values will drop into the single digits and teens with wind gusts ranging from 20-30 mph. Windy and dry conditions are also expected to impact Montana and Wyoming where gusts of 40 to 50 mph are possible. Meanwhile the heat will persist across the interior valleys of California into Arizona and southern Nevada with triple digit temperatures expected. A few thunderstorms are also possible over eastern Montana and over extreme southern California and Arizona. Over the eastern half of the country the main focus will revolve around cooler and wet conditions. Scattered showers and thunderstorms will deliver heavy rains along the Gulf Coast and extending into Georgia into South Carolina. Scattered showers and isolated thunderstorms will also occur over the Great Lakes. The only location in the east that will see a moderate risk of fire weather will be over southern Florida where hot, unstable and breezy conditions will prevail with relative humidity levels from 35-50% and wind gusts of 15-25 mph.

Cooler weather with scattered showers will continue over Alaska, however low fire potential will remain over the interior of the state where little rainfall has occurred recently.
