Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

Thunderstorms will develop across much of the Intermountain West today as monsoonal moisture aloft quickly surges into the region. This activity will initially be on the drier side, but some wetting rainfall is possible where several rounds occur. New lightning ignitions will be most likely across southern portions of the Great Basin and West Slope, extending into Arizona and northwestern New Mexico, where faster storm motions and parched fuels will align. Erratic outflow winds will likely challenge many of the established wildfires through the afternoon and evening hours, and severe wind gusts over 60 mph will be possible locally. Quick-moving but more isolated thunderstorms will also affect the Northwest into Idaho and western Montana. Hot, dry and unstable conditions will otherwise be the rule throughout the Intermountain West ahead of the more unsettled conditions. Dry air will overspread the Southeast behind a front that will focus widely scattered thunderstorms across the Florida peninsula. Showers and thunderstorms will spread a bit farther north and west in the Alaska Interior, with the warmest temperatures over western Alaska to the North Slope as areas farther south remain milder.
