Cumulative acres shown in the Active Incident Resource Summary Table may not be reflected in the YTD statistics due to a lag in units completing YTD adjustments in the SIT/209 Application. Otherwise, changes in agency YTD fires and acres reflect more accurate mapping or reporting adjustments.

Predictive Services Discussion:

Breezy west winds 20-30 mph with gusts up to 30-45 mph will occur across Montana and Wyoming eastward into the Upper Great Lakes. Minimum relative humidity will fall to 10-25%, lowest from eastern Wyoming northeast into southern Minnesota creating elevated to critical conditions. Breezy southwest winds 15-25 mph gusting 25-35 mph amid relative humidity of 5-15% will also develop from eastern New Mexico into the Texas Panhandle for elevated to critical conditions amid well above normal temperatures near 100°F. Meanwhile, low relative humidity in the single digits and teens will persist across the Great Basin, but wind will be lighter than the past two days, and light showers will continue in western Washington. Drier conditions are expected across the Southeast with minimum relative humidity of 20-35% but recent precipitation will mitigate. Dry conditions and near normal temperatures are expected across the Alaska Interior today, while isolated showers develop over southeast Alaska.
